Monthly Market Commentary

Recovery, full steam ahead? It would appear so. The stock market returned 11.02% during the first quarter of 2013, and the U.S. economy continues to grow at a slow but steady pace, despite apparent volatility and instability displayed by most major economic indicators.

GDP: For starters, real GDP growth rates have been highly volatile from quarter to quarter; for example, from 3.1% in Q3 2012 to only 0.1% in Q4 2012. However, it's important to keep in mind that the data includes some measurement and seasonal-adjustment issues that may blur the big picture a little bit. Morningstar economists forecast that GDP will grow at a slow, but sustainable 2.0%–2.5% rate in 2013, very similar to 2011 and 2012.

Employment: The private sector added only 95,000 jobs in March (compared with 254,000 in February). At first glance, this number is discouraging, and the lowest in nine months. However, similar to the case for GDP above, month-to-month data is volatile, influenced by weather and other seasonal factors, and often subject to revisions. Three-month average employment growth (YOY), a more reliable data point, does show slow erosion, but no catastrophic decline (2.1% in December, 2.0% in January, and 1.9% in February and March).

The Big Four: Given all the fiscal scares, Hurricane Sandy, volatile gasoline prices, and new taxes, the U.S. economy is doing surprisingly well, according to the Big Four economic indicators (private employment growth, retail sales, manufacturing, and real disposable income). Private sector year-over-year employment growth has been steady at 2% for almost two years, while retail sales growth (adjusted for inflation and excluding autos and gasoline) has been in the 2%–3% range for almost as long. Even U.S. manufacturing data hasn't been particularly volatile, especially if weather events are removed. Of the Big Four, only real disposable income has been very volatile, and most of that volatility is due to ever-shifting inflation rates (with food and energy showing the most volatility) and changes in government tax policy, not changes in wages.

Consumer: Consumer spending continues to drive the economy, constituting about 70% of GDP. Unfortunately, consumers were severely hit early in 2013 with soaring gasoline prices, a higher payroll tax, and delayed tax refunds. On the other hand, they also have a lot going for them, including lower inflation in many categories, better employment prospects, increasing home prices and related construction activity, and a much higher stock market and related wealth effects. While consumer spending is not as robust as it once was, it is clearly not falling apart in the middle of all the economic headwinds, either.

Quarter-end insights: A lot of fiscal issues were at least temporarily "settled" this quarter, helping to reassure both consumers and businesses. The fiscal cliff negotiations and the March sequestration resulted in a total deficit reduction of about $300 billion slated for 2013. The Fed plans on maintaining a relatively loose monetary policy, assuring investors that low interest rates and bond buybacks would continue to fuel further growth. As slow as this growth may be, the U.S. economy is better positioned and growing faster than many other developed economies. Some of the factors providing a longer-term advantage include newfound supplies of oil and gas, low electricity prices, more available land for building, and an improving auto industry.

In Europe, however, the situation isn't getting better, even when excluding the effects of the Cyprus situation. The Chinese economy seems to have bottomed, and future Chinese growth (if any) will likely be lower than previous peaks, and more likely to be consumption based than focused on infrastructure. Last, but not least, U.S. corporations are starting to invest for growth again (capital spending and acquisitions), which could prove to be an effective engine for further stock market appreciation.
